

CHAMBERQ

Laravel 12 · Filament 4 · stancl/tenancy · PHP 8.3

Developer Handoff

What this product is, what shipped from 25 July to 13 August 2026, what you must not change, and how to run it without breaking a chamber day.

Audience: Incoming / collaborating developer

Prepared: 13 August 2026

Repo: ChamberQ (product formerly Doctor Gemini / Solo Doc)

Status: Pre-production — feature-complete enough to demo and sell; live host not fully stood up

Read this first

This is not a hospital HIS. It is a chamber product for Bangladesh solo doctors and small clinics. Patients book a serial online and pay at the desk. There is no patient login and no payment gateway.

Before any code change, read these four files in the repo root: `decisions.md` , `bug_history.md` , `architecture.md` , `sitemap.md` . The operating protocol is `AGENTS.md` (symlink to `~/AGENTS.md`). Do not edit a copy of those rules.

BUILT IN

25 Jul → 13 Aug 2026

SELLABLE MODULES
3
Front door · Queue · Rx

MEDICINE SKUS
24,491
16,029 brands (BD market)

MAESTRO BUNDLE
৳15k / ৳3k
Setup / monthly. Clinic ৳75k / ৳7.5k

What the product does

Each paying doctor (a **tenant**) gets a branded website, online serial booking, a live waiting-room queue with outdoor TV, and a digital prescription pad. Super Admin creates tenants by hand after a WhatsApp sales chat. Marketers earn commission on setup and monthly fees (manual bKash). SMS is a prepaid wallet, not included in the plan.

Three product modules (à la carte for Solo / Maestro)

Module	Flag	What the doctor gets	List price
Front door	front_door	Website + online booking + Daily Roster. Ticket shows sitting name and time window only.	৳7,500 / ৳1,000 mo
Live queue	live_queue	Live Queue Control, outdoor TV /screen , ticket “now serving” + come-around ETA, Branding queue settings.	৳7,500 / ৳2,000 mo
Prescription	prescription	Consult Screen / Rx pad, print/share, medicines APIs, follow-up reminders, visit media.	৳2,500 / ৳0 mo

All three together is the Maestro bundle (internal plan key stays `solo`). Clinic tier still uses Clinic list price. Modules default **on** when the flag is absent so existing chambers keep the full product. Routes use `tenant.module:{name}` middleware (`EnsureTenantHasModule`).

Do not build online patient payment unless the owner explicitly asks. Pay-at-chamber is a logged decision (27 Jul, restated 31 Jul). Do not “restore a sane session timeout.” Do not restyle the solo patient homepage. Unlock phrases are in Section 6.

SECTION 2

How to run it

PHP 8.3+, Composer, Node. Local DB is SQLite. Production DB is MySQL — CI runs both. Do not drop the MySQL job to speed CI.

Setup

```
composer install
cp .env.example .env
php artisan key:generate
touch database/database.sqlite
php artisan migrate --seed
php artisan catalogues:load # required – ~24k medicines + conditions (~12s)
npm install && npm run build
php artisan serve
```

Migrations leave catalogues empty. Forgetting `catalogues:load` makes prescription pickers blank with no error. `app:production-check` treats an empty medicines or conditions table as a blocker. CI runs the load before the readiness gate.

Local URLs

URL	What
<code>http://localhost/</code>	Marketing site (Maestro + Clinic). WhatsApp CTAs. Captures <code>?ref=</code> / <code>?code=</code> .
<code>http://localhost/admin</code>	Super Admin (tenants, modules, marketers, commissions, Client Health, Research, backup).
<code>http://localhost/partner</code>	Marketer partner panel.
<code>http://localhost/solo/</code>	Demo solo tenant (path tenancy). Book at <code>/solo/book</code> , admin at <code>/solo/admin</code> .
<code>http://localhost/nusraturmi/</code>	Dr. Nusrat Urmi demo. Seed: <code>php artisan db:seed --class=NusratUrmiSeeder</code> .

Optional custom domain in local: `http://solo.localhost/` (root paths, no slug). Production uses the doctor's own domain the same way.

Tests

`php artisan test` (SQLite in-memory). MySQL: create `soldoc_mysql_test` , then `DB_CONNECTION=mysql` `DB_DATABASE=soldoc_mysql_test` ... `php artisan test` . Shell env overrides `.env` and `phpunit.xml` . GitHub Actions: `.github/workflows/tests.yml` — SQLite job + `phpunit-mysql` on MySQL 8.4.

Tenancy (the thing that bites)

- **Path tenancy** on the central host: `/{{tenant}}/...` (e.g. `/drkarim/book`).
- **Domain tenancy** for optional custom domains: routes at root (`/book` , `/admin`).
- Never use stanc1's `tenant_route()` for patient links. Use `tenant_web_url()` / `tenant_web_route()` / `tenant_safe_href()` / `TenancyUrl::publicAbsolute()` .
- Outbound links (SMS, WhatsApp, ticket Copy, TV bookmark) must go through `TenancyUrl::publicAbsolute()` or they bake localhost. Same-origin polls stay relative.

- All three Filament panels share one session cookie on one host. Role checks are not enough — tenant-owned clinical routes also check `User::belongsToCurrentTenant()` .

SECTION 3

Architecture snapshot

Single shared database, tenant-scoped rows. Live truth is `architecture.md` — this page is the map, not a substitute.

Stack

PHP ^8.3 (Composer `platform.php = 8.3.0` — match the live host, not a newer laptop). Laravel 12, Filament 4, Livewire, stanc/tenancy 3.10, Vite 7, Tailwind 4, PHPUnit 11. Filament HTML sanitiser pinned to Symfony 7 (8.x needs PHP 8.4).

Write paths (do not bypass)

Job	Single write path	Why it matters
Create a booking	<code>BookingService</code>	Row lock, serials, capacity, patient resolve, duplicate-person guard. Wizard, roster walk-in, and queue walk-in all go here.
Queue mutations	<code>LiveSessionService</code>	Every mutation is <code>DB::transaction + LockForUpdate()</code> on the session. Roster and Live Queue Control share this so the TV and ticket stay in sync.
Visit notes / Rx	<code>VisitRecordService::saveForCompletedBooking()</code>	Desktop pad, phone modal, and Complete visit all land here. Empty form creates no row.
Staff paper Rx	<code>VisitRecordService::saveStaffEnteredPrescription()</code>	Whitelist of fields. Cannot inject diagnosis/vitals. Off by default per doctor.
Cancel a date	<code>SlotBlockService</code>	Only path. Completes in-chamber patients; cancels waiting/called/skipped.
SMS	<code>SmsService::send()</code>	Every body goes through <code>GsmText::toSingleSegment()</code> . Debit before send, refund on hard failure. Never use <code>__()</code> in SMS bodies.
Doctor's shortlist	<code>MedicineService::saveDoctorMedicine()</code>	Only from My medicines or the ★ on the desk. Prescribing does not “learn.”

Key screens (tenant admin)

- **Daily Roster** — day's list, walk-ins, Mark Late, Mark Completed. When live queue is off: Arrived / Done / No-show.
- **Live Queue Control** — start sitting, Call next, arrived, skip, pause, end. Outdoor TV bookmark (date-free `/screen/{session}`). Catch-up banner for notes not written.
- **Consult Screen** — auto-follows `current_booking_id . ≥1024px` + in-chamber = full Rx desk. Phones keep the modal. Complete visit then Call next are two steps.
- **My medicines** — doctor-curated defaults + Rx packs. Packs are created here, applied on the desk.
- **Follow-up reminders** — WhatsApp confirm queue. SMS auto-sends 3 days before (daily 07:00).

Roles

Central: Super Admin, Marketer. Tenant: `admin` (full, but not the queue runner by default), `doctor`, `staff`. Queue is doctor or staff only — never the account-owner admin unless they also have that role. Consult Screen and visit

notes are doctor-only, except staff paper-entry when that doctor opted in.

SECTION 4

What shipped, in order

Source: `architecture_history.md` and `decisions.md`. Do not treat this as a licence to re-open locked UX.

When	What landed
25–28 Jul	Laravel 12 + Filament 4 + tenancy foundation. Payment gateway removed. Admin/doctor/staff. Prepaid SMS wallet. Operational Reports.
31 Jul	Hybrid path + domain tenancy. Marketer commissions + <code>/partner</code> . Waiting-time ETA. Project memory files created.
1–5 Aug	Solo homepage (then locked). Booking wizard mobile pass. Ticket print/PDF. Outdoor TV token-machine voice. Sessions never expire (owner decision). Clinic Clireo design approved.
6 Aug	Patient records (not just bookings). Consult Screen. Condition master list. Client Health. Clinic homepage design freeze for port.
7 Aug	Clinic site fully ported. Staff paper-prescription entry. Voice transcription deferred. Nusrat Urmi client seed.
8 Aug	Reclassified pre-production. MySQL proven (three SQLite-hidden migration bugs). Privacy + queue safety. Short Rx link <code>/p/{token}</code> . Vitals. <code>app:production-check</code> . GsmText at SMS choke point.
9–10 Aug	Disaster-recovery ZIP backup. Date-first booking. Clinic departments/blog CMS. Catalogue grew toward full BD market.
11 Aug	Patient merge no longer orphans notes. Full 24,491-SKU catalogue. Automatic prescribing “learning” removed — My medicines is hand-curated.
12 Aug	Desktop Rx pad. Three-layer dosing prefill. Packs. Condition advice presets. Warn-only Rx safety + 221 clash pairs. Follow-up reminders. BD pad print sheet. Portal lists up to 2 prescriptions.
13 Aug	Cross-chamber clinical share (opt-in, default on) + optional NID. Booking identity cleaned up. Product modules + Maestro sales name. Rising Star retired.

Prescription pad — current behaviour

Desktop Consult Screen is a BD pad: left clinical (C/C rows, H/O chips seeded from the patient file, O/E vitals with last-visit grey reference, Dx, Inv), right medicine table. Prefill is **doctor saved default** → **catalogue default** → **blank**, field by field. Vitals are never pre-filled. Packs apply but never wipe existing rows. Safety warnings never block save. The disclaimer must appear beside every warning (desk + modal) — `RxSafetyTest` fails if either drops it.

Print and patient copy share one Blade sheet. Patient copy is the full clinical pad (no voice/photo). Share: `/p/{token}` (48h) plus durable portal backup gated by phone.

SECTION 5

Journeys you must not break

Full map: `sitemap.md` . If you add/remove a route or change a CTA, update that file in the same task.

Patient

1. Open tenant home (or custom domain) → Book.
2. Wizard: chamber/doctor if needed → **When can you come?** (only dates with seats, 60-day window) → name / phone / optional NID / optional other WhatsApp / share-history checkbox.
3. Household on a known phone: masked initials only (F. R., 34), never full names on the public API.
4. Ticket UUID. Share WhatsApp / copy / print. Live queue poll if that module is on.
5. Later: `/portal` by phone — bookings + up to 2 recent prescriptions.
6. Waiting room: staff bookmark `/screen/{session}` once (always today).

Sitting day

1. Queue runner (staff or doctor per Branding) opens Live Queue Control → Start → Call → Patient arrived → doctor writes on Consult Screen.
2. Doctor: Complete visit (patient stays on screen for print/WhatsApp) → Call next.
3. Mark Late (roster or queue) texts waiting patients if that doctor's late SMS is on — after-response job, not inline, because there is no queue worker.
4. End session / doctor absent: in-chamber patient is completed, not cancelled; staff get a tell-cancelled-patients hand-off.

Sales / Super Admin

No self-signup. WhatsApp CTA → Super Admin creates tenant (slug, modules, marketer, discount, doctor login email required) → confirm bKash → commissions move pending → owed → paid. Client Health is counts only — never patient names or diagnoses. Research is coded-diagnosis aggregates with k-anonymity (min group 10).

SECTION 6

Locked decisions — do not “fix”

A security audit, a Laravel default, or “this lifetime looks wrong” does not unlock these. Only the exact phrases do.

Lock	Rule	Unlock phrase
Pay at chamber	No bKash/Nagad/SSLCommerz for patients. Do not suggest or build pre-payment.	Owner explicitly asks for online / pre-payment
Solo patient homepage	Do not edit <code>resources/views/tenant/solo/webpage.blade.php</code> or <code>tenant/solo/sections/**</code> . Book CTAs must keep <code>tenant_safe_href(..., '/book')</code> .	update patient homepage or change patient homepage
Session never expires	<code>SESSION_LIFETIME=525600</code> in <code>.env</code> , <code>.env.example</code> , and <code>config/session.php</code> default. <code>SESSION_EXPIRE_ON_CLOSE=false</code> . <code>AUTH_PASSWORD_TIMEOUT=31536000</code> . Do not tidy the config default back to 120.	change session expiry or restore session timeout
No self-signup	Marketing CTA is WhatsApp. Super Admin creates tenants.	Owner asks to change sales model
No prescribing “learning”	Do not restore usage counters / auto-ranking from what was prescribed. My medicines is explicit curation only.	Owner asks to bring learning back
No named clinician on drug list	No <code>reviewed_by</code> . Disclaimer beside every Rx warning. Incomplete list is acknowledged in product copy.	Owner asks to name a reviewer

Pre-production (since 8 Aug)

This repo is **not** a prototype. Security, backups, MySQL correctness, and unrecoverable-data bugs are in scope by default. That still does not unlock the homepage or session locks above.

How to close a task

- If you add/delete/rename a file under `app/`, `routes/`, `config/`, `database/`, `resources/views/`, or `public/` — update `architecture.md` and append one line to `architecture_history.md`. No exemption for “only a bug fix.”
- Behavioural changes are architecture changes even with no new files.
- Never rewrite past `architecture_history.md` entries. Append a correction.
- Verify claims with `git log -5` and by reading the file. Do not copy unverified audit summaries into the log.

Not live yet, and traps already paid for

Known production gaps (as of 13 Aug)

Gap	Why it matters
Nothing backed up off the machine	In-app ZIP exists for table CSVs. Voice notes and prescription photos are still on local disk and not in the ZIP.
No real SMS sent	<code>SMS_DRIVER</code> defaults to <code>log</code> . Confirmations would silently not go out.
Password-reset mail goes nowhere	<code>MAIL_MAILER=log</code> .
No production host config	Local is still debug + SQLite. Run <code>php artisan app:production-check</code> as the last deploy step.
No error monitoring	A crash on a sitting day would be silent.

Traps (do not reintroduce)

- **SQLite is not proof.** Three migrations were unrunnable on MySQL (tenants table order, composite FKs, SET NULL on composite keys). Always think MySQL.
- **Date columns:** use `DateOnly` cast and plain `where()`, not `whereDate()` — the function kills the booking indexes and SQLite stores a time component.
- **SMS segments:** one non-GSM character (em dash) turned a 1-credit message into 3. Guard is in `GsmText` inside `send()`, not a comment.
- **Patient merge** must move `visit_records` and prescriptions via `repointPatientOwnedRows()`. Moving only bookings NULLED clinical history.
- **Filament bulk delete** authorizes `deleteAny()`, not `delete()`. Policies that omit it allow the bulk action. Chambers/Doctors have no bulk delete.
- **This panel has no Tailwind on Live Queue Control** — use scoped plain CSS (`!q-`). Arbitrary utilities are silently dropped.
- **There is no queue worker.** Jobs that must run today use `->afterResponse()` (doctor-late SMS). A queued job would never send.
- **Medicine search** must not hydrate the whole 24k catalogue. Path is `MedicineService::search()` only.
- **Dose chips** come from the catalogue for that brand, never a hardcoded 500/10/20/40/5 mg list.

Deferred on purpose

- Voice transcription — code stashed in `docs/deferred/voice-transcription/`. Do not reload it.
- Handwriting OCR on prescription photos.
- Licensed US drug-interaction database. Coverage report: 3.7% of real BD medicines have no US vocabulary entry. Shipped checker is a short curated list + disclaimer.

First week on the repo: run setup, book a serial on `/solo/book`, start a sitting, write a prescription on Consult Screen at desktop width, print it, open the patient copy. Then read `bug_history.md` end to end before touching queue, SMS, or tenancy URLs.
